## ASPIRATION

The suction system industrial allows the capture located waste, resulting particles or shavings of the production process and its centralized storage. IT'S still possible to separate these waste, either by typology or granulometry.

Through pressure (positive or negative) caused by the fan in the duct network these systems allow transporting from materials raw to waste from one place to another with reduced (almost null) human intervention.

## INDUSTRIAL VENTILATION

These systems make it possible to improve indoor air quality, with the renewal thereof, safeguarding the well-being of all workers. Can be done actively (using fans) or passive way (using skylights). They can be used to combat fires, both extracting fumes and preventing them from spreading to unaffected areas.

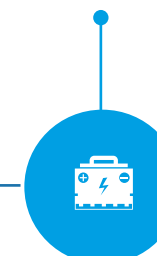

It occurs through a physical phenomenon that consists of converting water into steam, increasing the level of humidity in the air. If this process takes place without being need an external power source heat needed to evaporate the water is removed air, causing it to cool.
